

## **Python 3 Beginner's Reference Cheat Sheet**

Alvaro Sebastian http://www.sixthresearcher.com

### Main data types

**boolean** = *True / False* 

integer = 10

float = 10.01

string = "123abc"

list = [ value1, value2, ... ]

dictionary = { key1:value1, key2:value2, ...}

# Numeric operators

addition

\* multiplication

subtraction

/ division

\*\* exponent

% modulus

// floor division

# Boolean operators

and logical AND
or logical OR
not logical NOT

# Special characters

Comparison

operators

different

higher or equal

lower or equal

egual

higher

lower

==

!=

>

<

>=

<=

# coment
\n new line
\<char> scape char

### String operations

**string[i]** retrieves character at position i

string[-1] retrieves last character

string[i:j] retrieves characters in range i to j

### List operations

list = [] defines an empty list
list[i] = x stores x with index i

list[i] retrieves the item with index I

list[-1] retrieves last item

list[i:j] retrieves items in the range i to j
del list[i] removes the item with index i

### **Dictionary operations**

dict = {} defines an empty dictionary
dict[k] = x stores x associated to key k
dict[k] retrieves the item with key k
del dict[k] removes the item with key k

### String methods

string.upper() converts to uppercase string.lower() converts to lowercase string.count(x) counts how many times x appears string.find(x) position of the x first occurrence string.replace(x,y) replaces x for y returns a list of values string.strip(x) delimited by x string.join(L) returns a string with L values joined by string string.format(x) returns a string that includes formatted x

#### List methods

list.append(x) adds x to the end of the list list.extend(L) appends L to the end of the list

**list.insert(i,x)** inserts x at i position

**list.remove(x)** removes the first list item whose

value is x

list.pop(i) removes the item at position i and

returns its value

list.clear() removes all items from the list returns a list of values delimited

by x

**list.count(x)** returns a string with list values

joined by S

list.sort() sorts list items

list.reverse() reverses list elements list.copy() returns a copy of the list

### **Dictionary methods**

dict.keys() returns a list of keys dict.values() returns a list of values dict.items() returns a list of pairs (key, value) dict.get(k) returns the value associtated to the key k removes the item associated to dict.pop() the key and returns its value dict.update(D) adds keys-values (D) to dictionary dict.clear() removes all keys-values from the dictionary dict.copy() returns a copy of the dictionary

### **Python 3 Beginner's Reference Cheat Sheet**

Alvaro Sebastian http://www.sixthresearcher.com

#### **Built-in functions**

print(x, sep='y') prints x objects separated by y

**input(s)** prints s and waits for an input

that will be returned

**len(x)** returns the length of x (s, L or D)

min(L) returns the minimum value in L

max(L) returns the maximum value in L

**sum(L)** returns the sum of the values in L

range(n1,n2,n) returns a sequence of numbers

from n1 to n2 in steps of n

**abs(n)** returns the absolute value of n

round(n1,n) returns the n1 number rounded

to n digits

type(x) returns the type of x (string, float,

list, dict ...)

str(x) converts x to string

list(x) converts x to a list

int(x) converts x to a integer number

float(x) converts x to a float number

**help(s)** prints help about x

map(function, L) Applies function to values in L

# Conditional statements

if <condition>:

<code>

else if <condition>:

<code>

else:

<code>

if <value> in <list>:

#### Data validation

try:

<code>

except <error>:
 <code>

else:

<code>

# Working with files and folders

import os
os.getcwd()
os.makedirs(<path>)
os.chdir(<path>)
os.listdir(<path>)

#### Loops

while <condition>: <code>

for <variable> in <list>:
 <code>

for <variable> in

range(start,stop,step):

<code>

for key, value in
dict.items():
 <code>

## Loop control statements

**break** finishes loop

execution

**continue** jumps to next iteration

pass does nothing

# Running external programs

import os
os.system(<command>)

#### **Functions**

def function(<params>):
 <code>

### Modules

return <data>

import module
module.function()

from module import \*
function()

# Reading and writing files

f = open(<path>,'r')
f.read(<size>)
f.readline(<size>)
f.close()

f = open(<path>,'w')
f.write(<str>)
f.close()
